Managing Diabetes and Hyperglycemia in the Hospital Setting Boris Draznin,2016-05-20 As the number of patients with diabetes increases annually, it is not surprising that the number of patients with diabetes who are admitted to the hospital also increases. Once in the hospital, patients with diabetes or hyperglycemia may be admitted to the Intensive Care Unit, require urgent or elective surgery, enteral or parenteral nutrition, intravenous insulin infusion, or therapies that significantly impact glycemic control (e.g., steroids). Because many clinical outcomes are influenced by the degree of glycemic control, knowledge of the best practices in inpatient diabetes management is extremely important. The field of inpatient management of diabetes and hyperglycemia has grown substantially in the last several years. This body of knowledge is summarized in this book, so it can reach the audience of hospitalists, endocrinologists, nurses and other team members who take care of hospitalized patients with diabetes and hyperglycemia.

Insulin Action Ashok K. Srivastava,Barry I. Posner,1998-05-31 In 1996 the 75th anniversary of the discovery of insulin was celebrated at the University of Toronto, the scene of that discovery in 1921. This volume was stimulated by the scientific program which was staged at that time and brought together much of the world's best talent to discuss and analyze the most recent developments in our understanding of pancreatic function, insulin secretion, the interaction of insulin with its target tissues, the mechanism of insulin action at the cellular level, and the defects which underlie both Type I (insulin-dependent

diabetes mellitus, IDDM) and Type II (noninsulin-dependent diabetes mellitus, NIDDM) forms of the disease. We have chosen to focus the present volume on work related to insulin action.

Oral Anticoagulation Therapy Kathryn Kiser,2017-05-31 Given the amount and complexity of information surrounding the the target specific oral anticoagulants a lengthy didactic educational format has the potential to be overwhelming to the reader and difficult to translate and apply to direct patient care. The proposed book will educate clinicians utilizing a series of clinical cases to simultaneously develop the readers' knowledge base, problem-solving skills, and practically apply their new knowledge to a variety of clinical situations. These will be short focused case presentations that provide critical information and pose questions to the reader at key points in the decision making process. The cases will be relevant to what clinicians will encounter not only on a daily basis, but also reflective of scenarios that clinicians will not encounter regularly, but that they will have to act upon (e.g. a bleeding patient, patient scheduled for elective or emergent procedure, patient with changing renal function, patient on drugs that have a plausible yet unstudied drug interaction with a target specific oral anticoagulant etc). Included in the case studies will be evidence-based discussions (with appropriate references) that provide immediate feedback on the different treatment alternatives that were offered. The case studies will be designed to instruct the reader how to select and effectively utilize the most appropriate agent for a given clinical scenario. They will focus on key

features of the target specific oral anticoagulants, what they have in common, how they are unique from each other, as well as illustrating the clinical decision process one should take when selecting an agent or managing a patient already receiving one of the target specific oral agents.
